PURPOSE: To easily and quickly treat cut sheets without the needs for key operation to select papers by determining the preferential orders of mediums to be used in advance.

CONSTITUTION: Preferential orders of papers are determined by a setting switch, and various kinds of mediums are selected according to a flow chart and sucked into a printing section. If a setting switch is set at the manual preferential position, for example, the presence or absence of a single slip is detected by a sensor 21. When a single slip is present, a feeding roller 26 is closed, a paper feeding motor 6 is driven, and the single slip is sucked in until detected by the sensor 23. When the single slip is not detected, the presence or absence of cut sheets is detected by a sensor 22, and when the cut sheet is detected, a picking motor 16 and the paper feeding motor 6 are driven to suck the cut sheet 18 until detected by the sensor 23.

a: starting, b: waiting for suction command, c: setting switch, d: manual, e: manual preference, f: cut sheet preference, g: cut sheet, h: manual medium setting?, i: manual medium setting?, j: cut sheet setting?, k: cut sheet setting?, l: alarm display, m: manual medium sucking, n: cut sheet sucking, o: alarm display, p: suction ending
